Employee Management System

Project Overview:

This project is a Java-based Employee Management System developed using Object-Oriented Programming (OOP) concepts with a backend MySQL database. It helps in storing and managing employee records, their department and designation, and login credentials.

Tables Used in Project

Although I created complete Department and Designation tables in the database, only two columns from each are used in the core project:

Table	Used Columns in Project
Department	Dept_ID, Dept_Name
Designation	Desig_ID, Desig_Title

These columns were used in the **Employee Form** through **dropdowns (combo boxes)** to allow the user to select department and designation while saving employee records and sending Data to Database..

✓ Why only two columns?

- I keep only ID and Title/Name for simplicity and relevance, are needed to link with the employee.

- This shows data abstraction – only the essential information is exposed in the UI.

(DATABASE DESIGN)

1. Department Table:

Stores information about different departments in the organization.

Key Fields: Dept_ID, Dept_Name, Dept_Head, Location, Contact_Phone

2. Designation Table:

Holds designation titles and their respective salary range and level.

Key Fields: Desig_ID, Desig_Title, Salary_Range, Level

3. Emp (Employee) Table:

Contains detailed information about employees, including department and designation through foreign keys.

Key Fields: empid, name, F_name, DOB, Phone, Email, Address, Education, Adhar_No, Dept_ID, Desig_ID, Gender, Salary

4. Login Table:

Stores login credentials for admin users. Key Fields: Username, Password

5. Loginemp Table:

Stores login credentials for employee users using their empid as a reference.

Key Fields: empid, Password

GUI Explanation:

The Add/Update Employee Form has:

- Text fields for Name, DOB, Phone, Email, etc. - Dropdowns for Department and Designation, populated from the database.
- These dropdowns show department/designation names but internally store their ID.

There are 10 classes in Project

❓ **login1.java** .User login screen through username and password ❓ **login.java** – Admin login through Emp_id and Password...

❓ **project.java** – The main entry point of the application that starts the system.(Show Display) ❓ **role.java** – Manages user roles (like Admin or User) and loads interface for them..

❓ **home.java** – Admin dashboard shown after

successful login.

? **employeedashboard.java** – Dashboard shown to regular Users after login.

? **addemployee.java** – Form to add a new employee and assign role, department, etc.

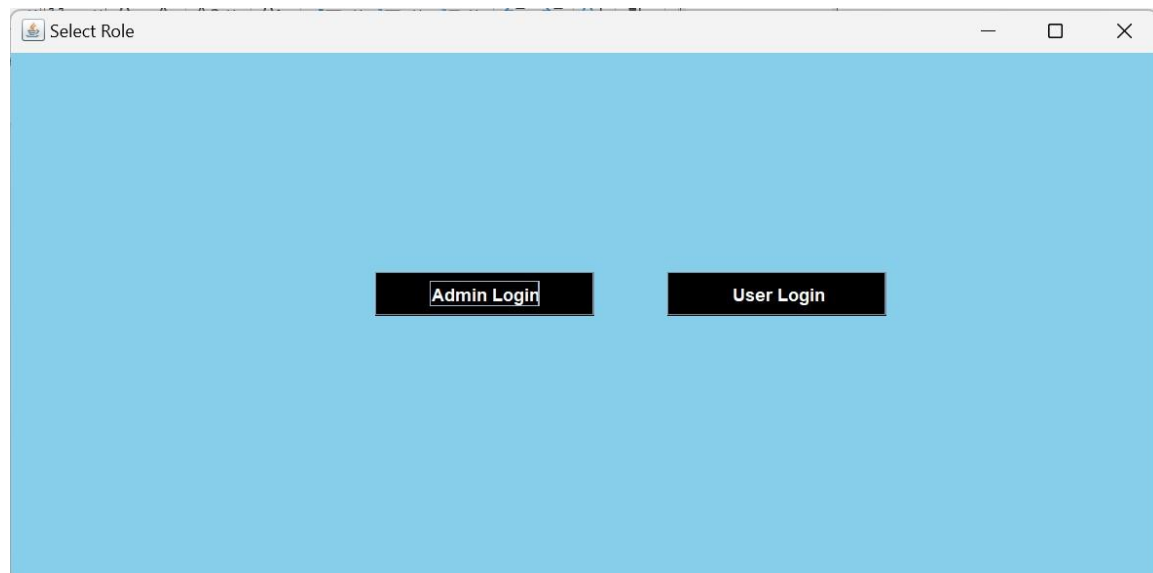

? **updateemployee.java** – Form to update/edit an existing employee's details.

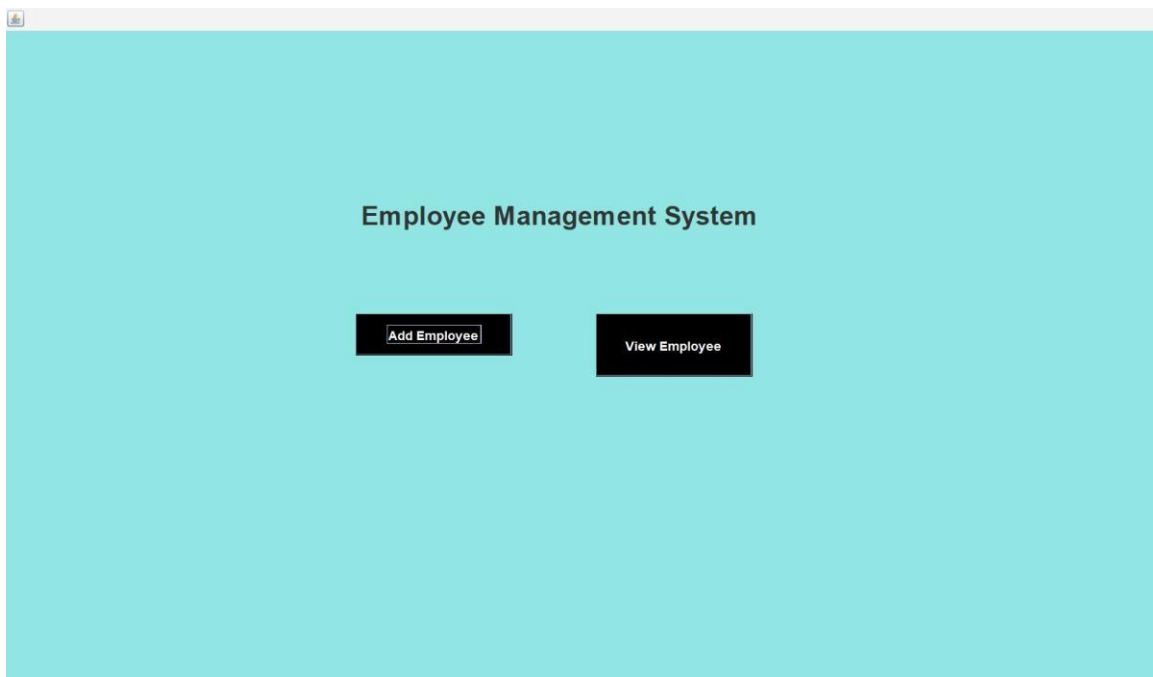

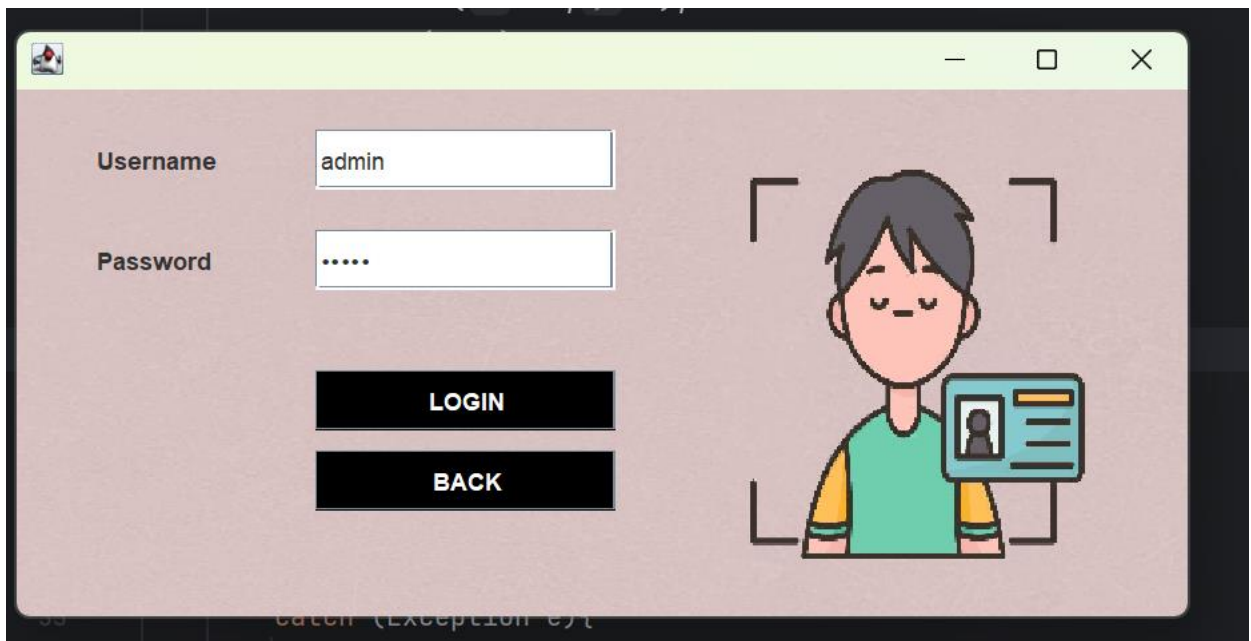

? **conn.java** – Handles database connection (JDBC) for the entire system.

? **viewemployee.java** – Displays all employee records in a table format.

Here How it Works.....

Employee Management Sys
